CLASS IV RESTORATION

Dr. Buddy Mopper
Notice the 2 millimeter long bevel

Butt joint on the lingual

Renamel Nano extended to the correct incisal length
Notice how the Renamel Nano is applied as a continuation of the long bevel, leaving room for opaque and microfill.

Notice the lower value of the material used to lengthen the Incisal edge.

Application of Creative Color Opaque the same shade as the Renamel Nano. Opaque is used to increase the value before placement of microfill.

After placement of Renamel Microfill always check from the incisal view to ensure proper contour.
This is the reason why we check from the incisal view. Notice the area that is under contoured at this time. Simply add needed microfill.

Microfill added to increase incisal edge thickness to allow you to contour material properly.

Invisible restoration after contouring, finishing and polish.

Final Retoration. Note: Color blending, perfect color match, and incisal translucency.
